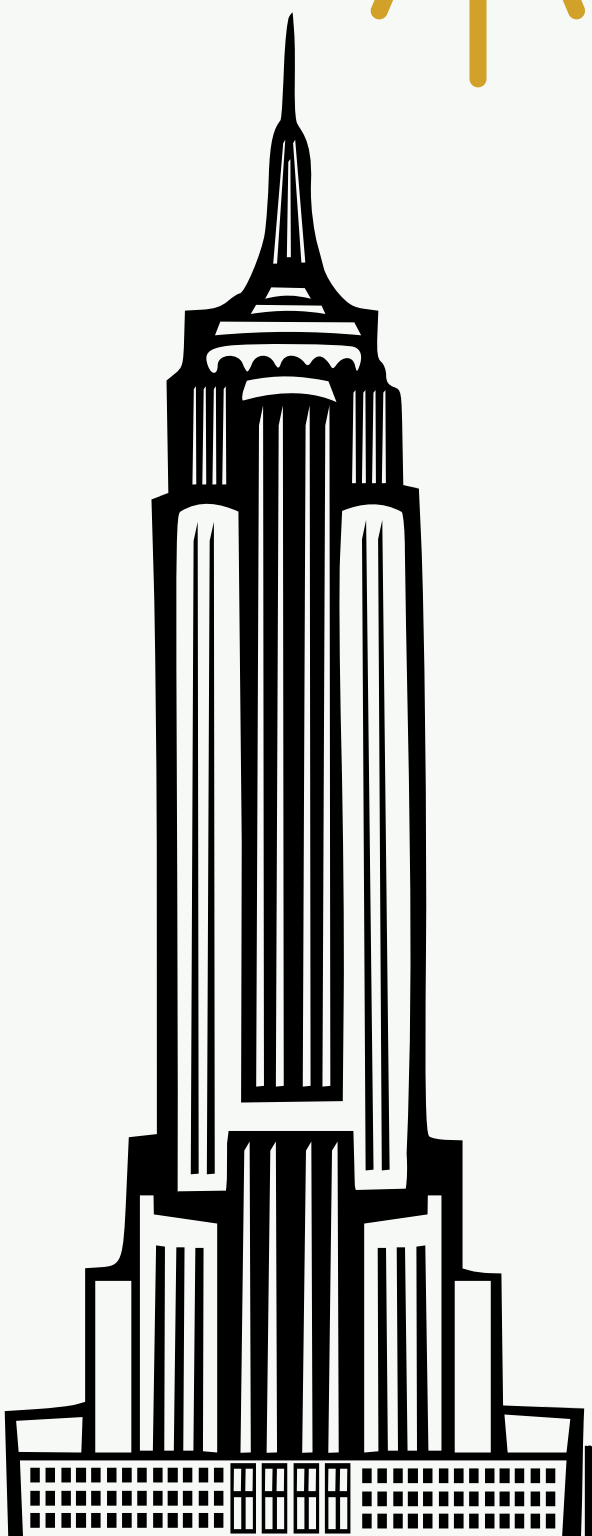
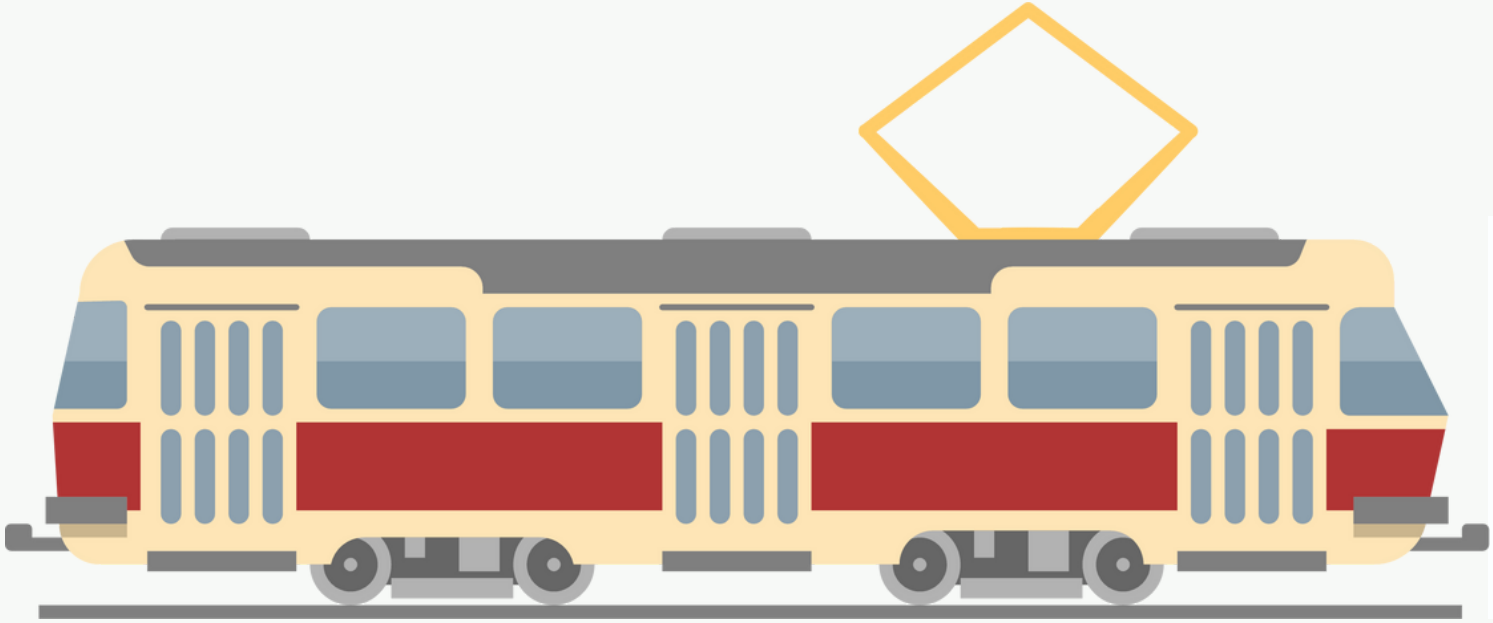
New mobility schemes

Cities are hugely popular and will continue to be so in the future, as population grows. Citizens have easy access to work, learning, healthcare, food, shops, and all sorts of social, cultural or sports activities. But are cities really delivering these promises?



The growth of cars in the past 50 years and the adaptation of the infrastructure to this dominant mode of transport, have transformed our cities into urban areas with a low quality of life: air pollution, noise exposure, car crashes, congestion are threatening the vibrant city life. And the growth of cars comes at huge social, economic and environmental costs.

However, a turning point may be reached. More and more cities are investing to transform back to more liveable urban spaces, and cycling and walking are part of a cost-efficient solution. We move away slowly from owning a private car towards shared mobility and the cycling share is growing in most European cities.



Philippe Crist, OECD: “One single mode of transport will not be sufficient to fulfill our needs for access. We need more efficient, smaller and fewer cars, high quality public transport and we need to reconfigure cities to support walking and cycling. cycling will be essential in this mix to move freely and easily.”

Start your journey towards a greener and sustainable city.
